

**Advanced Mathematics  
Support Programme®**

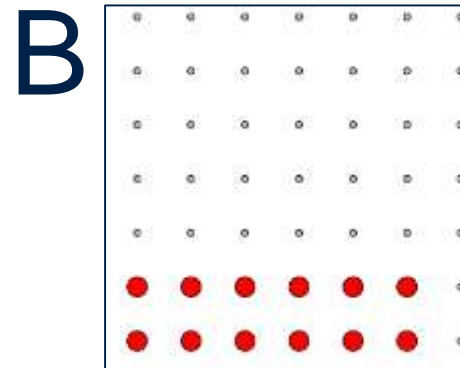

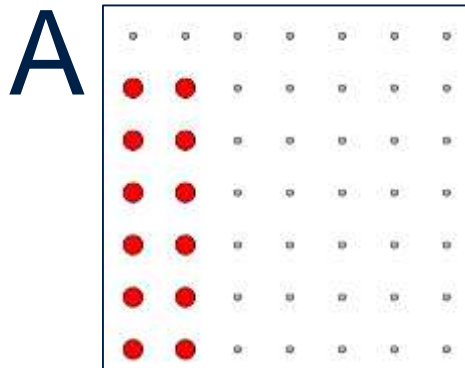

How would you work out  $32 \div 8$ ?

- Did you use the fact that you know  $8 \times 4 = 32$ ?

Often we use multiplication to help us do division as it is more straightforward.

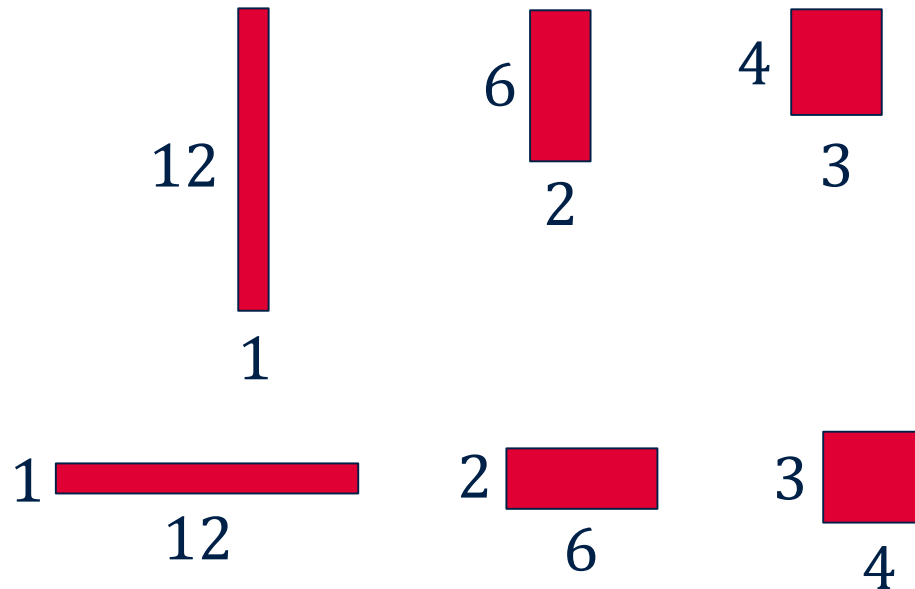

- The same is true for **factorising** and **expanding**.
- It can often be easier to expand than to factorise
- So use expanding to help you factorise

I have 12 red counters and a large sheet of dotted paper. How many different rectangular arrays can I make using all 12 counters?

- An array is an arrangement of objects in rows and columns
- For this activity we will count A and B as different arrays as they have different orientations

This problem is equivalent to finding the number of rectangles with area 12 that have integer length sides, and counting 2 by 6 as different to 6 by 2

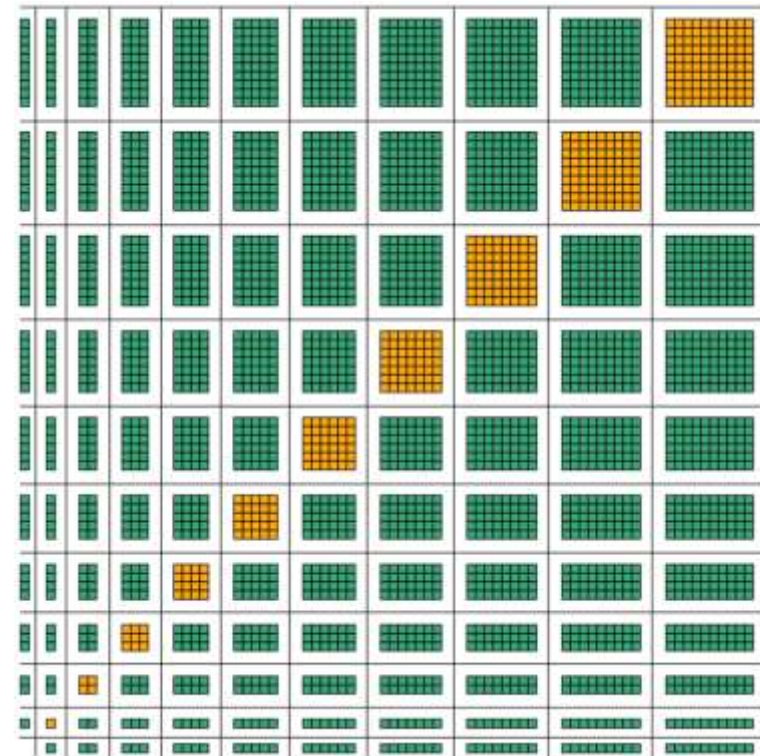

There are six arrays for 12 counters.

How many different arrays are there for:

- 7 counters?
- 15 counters?
- 25 counters?
- A prime number of counters?
- What is special about numbers with an odd number of arrays?

No of Counters	No of Arrays	
7	2	$(1 \times 7), (7 \times 1)$
15	4	$(1 \times 15), (3 \times 5), (5 \times 3), (15 \times 1)$
25	3	$(1 \times 25), (5 \times 5), (25 \times 1)$
Prime	2	$(1 \times p), (p \times 1)$
1	1	$(1 \times 1)$
Square number	Odd number	

Remember the Visual Multiplication Square from the Expanding session? **How does that help?**

Fully factorise the following:

1.  $5x - 30$

5.  $7a^2b + 21ab - 14a$

2.  $9x + 6$

6.  $12x^2 + 12xy + 12y^2$

3.  $x^2 + 6x$

7.  $3t(t - 1) + 7(t - 1)$

4.  $6y^3 - 12y$

8.  $2x(x^2 + 3) - 5(x^2 + 3)$

# Factorising 1

Solutions on the next slide....

Fully factorise the following:

$$1. \quad 5x - 30 \quad \longrightarrow \quad = 5(x - 6)$$

$$2. \quad 9x + 6 \quad \longrightarrow \quad = 3(3x + 2)$$

$$3. \quad x^2 + 6x \quad \longrightarrow \quad = x(x + 6)$$

$$4. \quad 6y^3 - 12y \quad \longrightarrow \quad = 6y(y^2 - 2)$$

Fully factorise the following:

$$5. \quad 7a^2b + 21ab - 14a \quad \longrightarrow \quad = 7a(ab + 3b - 2)$$

$$6. \quad 12x^2 + 12xy + 12y^2 \quad \longrightarrow \quad = 12(x^2 + xy + y^2)$$

$$7. \quad 3t(t - 1) + 7(t - 1) \quad \longrightarrow \quad \begin{aligned} &3t(t - 1) + 7(t - 1) \\ &= (t - 1)(3t + 7) \end{aligned}$$

The common factor to take out is  $(t - 1)$

$$8. \quad 2x(x^2 + 3) - 5(x^2 + 3) \quad \longrightarrow \quad \begin{aligned} &2x(x^2 + 3) - 5(x^2 + 3) \\ &= (x^2 + 3)(2x - 5) \end{aligned}$$

The common factor to take out is  $(x^2 + 3)$

Fully factorise the following:

1.  $7x + 28$

5.  $3x^3y - 12xy^2 + 6xy$

2.  $14 - 21x$

6.  $8a^3b + 6y^2b - 10b$

3.  $y^2 - 8y$

7.  $6x(x + 3) + 5(x + 3)$

4.  $3t^4 + 9t^2$

8.  $7y(3 - 2y) - 2(3 - 2y)$

# Factorising 2

Solutions on the next slide....

Fully factorise the following:

$$1. \quad 7x + 28 \quad \longrightarrow \quad = 7(x + 4)$$

$$2. \quad 14 - 21x \quad \longrightarrow \quad = 7(2 - 3x)$$

$$3. \quad y^2 - 8y \quad \longrightarrow \quad = y(y - 8)$$

$$4. \quad 3t^4 + 9t^2 \quad \longrightarrow \quad = 3t^2(t^2 + 3)$$

Fully factorise the following:

$$5. \quad 3x^3y - 12xy^2 + 6xy \quad \longrightarrow \quad = 3xy(x^2 - 4y + 2)$$

$$6. \quad 8a^3b + 6y^2b - 10b \quad \longrightarrow \quad = 2b(4a^3 + 3y^2 - 5)$$

$$7. \quad 6x(x + 3) + 5(x + 3) \quad \longrightarrow \quad \begin{aligned} &\text{The common factor to take out is } (x + 3) \\ &6x(x + 3) + 5(x + 3) \\ &= (x + 3)(6x + 5) \end{aligned}$$

$$8. \quad 7y(3 - 2y) - 2(3 - 2y) \quad \longrightarrow \quad \begin{aligned} &\text{The common factor to take out is } (3 - 2y) \\ &7y(3 - 2y) - 2(3 - 2y) \\ &= (3 - 2y)(7y - 2) \end{aligned}$$

You are told that

$$ab = 245$$

$$bc = 635$$

$$a + c = 88$$

What is the value of  $b$ ?

Hints available on the next slide

You are told that

$$ab = 245$$

$$bc = 635$$

$$a + c = 88$$

What is the value of  $b$ ?

- Try adding the first two expressions together
- Now factorise
- Have another look at the question

You are told that

$$ab = 245$$

$$bc = 635$$

$$a + c = 88$$

What is the value of  $b$ ?

$$ab + bc = 245 + 635$$

$$b(a + c) = 880$$

$$b(88) = 880$$

$$b = 10$$

By considering prime factors, and without a calculator, find the square root of  $27 \times 147$

Hints available on the next slide

By considering prime factors, and without a calculator, find the square root of  $27 \times 147$

- Draw prime factor trees for 27 and 147 separately
- Write down  $27 \times 147$  expressed as a product of their prime factors
- Simplify the expression
- Have another look at the question

By considering prime factors, and without a calculator, find the square root of  $27 \times 147$

$$27 = 3^3$$

$$147 = 3 \times 7^2$$

Therefore  $27 \times 147 = 3^3 \times 3 \times 7^2 = 3^4 \times 7^2$

$$\sqrt{27 \times 147} = \sqrt{3^4 \times 7^2} = \sqrt{3^4} \times \sqrt{7^2} = 3^2 \times 7 = 63$$

Simplify  $\sqrt{2y^2(x+3)^2 + 7(x+3)^2y^2}$

Hint available on the next slide

Simplify  $\sqrt{2y^2(x+3)^2 + 7(x+3)^2y^2}$

- Factorise first (Q7 and Q8 from Factorising 1  will help)
- Have another look at the question

Simplify  $\sqrt{2y^2(x+3)^2 + 7(x+3)^2y^2}$

The common factor is  $(x+3)^2$

$$\sqrt{2y^2(x+3)^2 + 7(x+3)^2y^2}$$

$$= \sqrt{(x+3)^2(2y^2 + 7y^2)}$$

$$= \sqrt{9y^2(x+3)^2}$$

$$= 3y(x+3)$$

Simplify

$$\frac{4x^{2.5} - 6\sqrt{x}}{2x^2 - 3}$$

Hints available on the next slide

## Simplify

$$\frac{4x^{2.5} - 6\sqrt{x}}{2x^2 - 3}$$

- Rewrite  $\sqrt{x}$  as a power of  $x$
- What is 2.5 as a fraction?
- Factorise the numerator
- Have another look at the question

Simplify

$$\begin{aligned} & \frac{4x^{2.5} - 6\sqrt{x}}{2x^2 - 3} \\ &= \frac{4x^{2.5} - 6x^{0.5}}{2x^2 - 3} \\ &= \frac{2x^{0.5}(2x^2 - 3)}{2x^2 - 3} = 2x^{0.5} = 2\sqrt{x} \end{aligned}$$

Pick 3 different integers from 1 to 10

Place your numbers in the boxes in as many different ways as possible (i.e 6 ways)

$$\square (\square x + \square)$$

- Write down all the expressions
- Multiply them all out
- Add up all your results and simplify
- Now factorise that answer

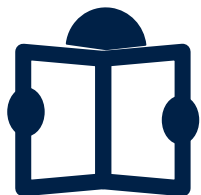

Try again with a different set of 3 numbers

What do you notice? Can you prove it?

# Factor Problem
